retaining wall systems

RomanPisa®

The RomanPisa system takes retaining walls to a whole new level of appearance. RomanPisa capitalizes on the strength and ability of the Pisa2® system and adds its own natural weathered appearance to create the most popular look for segmental retaining wall systems on the market today.

RomanPisa is manufactured by putting a typical Pisa2 unit through a specialized process that rounds off the edges and corners, and gouges the face. This gives the wall a worn cobble appearance that looks like real stone, not concrete. RomanPisa can be substituted for any Pisa2 system application.

RomanPisa is a complete retaining wall system that includes corners and a coping stone. A jumper and half unit (available in some locations) allow for multiple design options. Curved walls as well as straight walls and steps can be constructed with RomanPisa, giving architects, engineers, contractors and homeowners the flexibility of design and the natural appearance they are looking for.

Risi Stone Systems Overview

RisiStone retaining walls are constructed by stacking the units. No mortar or mechanical fasteners are required. All systems use a patented shear connection that makes the units self-aligning and self-battering. This creates a strong uniform interlock throughout the wall and connection with reinforcement.

RisiStone retaining walls do not require reinforced concrete footings. They are designed to rest on a flexible, compacted gravel base.

All units are solid, manufactured from high strength concrete.
